"Data on the Surgical Importance of 'Gastric Hemorrhage'."

Budapest, Orvosi Hetilap, Vol 108, No 9, 26 Feb 67, pages 392-394.

Abstract: [Authors' Hungarian summary] On the basis of data involving 120 patients as well as literature data, the following conclusion was arrived at. If the hemorrhage is of ulcerous origin and it is possible to attain a bleeding-free interval, it is better to perform surgery during such an interval. In the case of non-controllable or rapidly recurring hemorrhage, good results can be expected only from an intervention as early as possible. Should it be impossible to locate the site of the hemorrhage at operation, in a case where rupture of an esophageal varix or some hematological change can be excluded, an empirical resection may also provide good results. 19 Eastern European, 23 Western references.

"Pancreas Heterotropy in the Stomach and in the Duodenum"

Budapest, Magyar Sebeszet, Vol 19, No 5, Oct 66; pp 333-336.

Abstract: Two cases of pancreas heterotropy are described. In one case the pancreas heterotropy was detected by histological study of the duodenum performed on the occasion of a resection carried out on account of ulcer. In the second case the resection was carried out because of suspicion of a prepyloric malignant tumor, and the histological examination led to the correct diagnosis. 20 References, mainly Western.

Tests and Laboratory Methods in Diagnosis of Cow Mastitis."

Prague, Veterinarni Medicina, Vol 11, No 6, Jun 66, pp 353-360

Abstract [Author's English summary modified]: The California
Mastitis Test (CMT) is the most sensitive, followed by the NK
test, Duba test, Whiteside's Test, and bromothymole paper strips.
The bromothymole paper strip test does not give reliable results.
By bacteriological examination the following germs were isolated
from milk: Streptococcus agalactiae in 15.2% of samples, Staphy-
lococcus pyogenes 13.8%; Escherichia coli 3.0%, Pseudomonas aerugin-
osa 2.8%, Streptococcus dysgalactiae 2.5%, and S. uberis 0.8%.
Non-specific findings were made in 36.8% of the samples examined.

"Fundamental Indications of the Therapy of Preinvasive Carcinoma: Therapeutic Results."

Budapest, Orvosi Hetilap, Vol 107, No 40, 2 Oct 66, pages 1881-1883.

Abstract: [Authors' Hungarian summary] The final diagnosis of preinvasive carcinoma can be arrived at by means of conization or, in case of confirmatory indications, by a detailed histological diagnosis after hysterectomy. If the lesion is surrounded by healthy epithelium within the cone, conization is accepted as the final therapeutic measure in women still at child-bearing age when it is combined with careful colposcopic and cytological follow-up examinations. Among the 27 conizations performed in the author's patient material, it proved to be the final therapeutic procedure in 15 (55.5%). When the process has spread past the limits of the cone, vaginal or abdominal simple hysterectomy must be performed irrespective of the age of the patient. Recurrences occurred in 1-10% of the cases; therefore, in women at child-bearing age, we cannot turn away from the performance of conservative operations. 8 Eastern European, 46 Western references.
